

# Motion in 2D

My website:  
<https://scienceknowledge.webedu.com/>

# Learning Objectives

- Vector Components (Trigonometry)
- Kinematic Equations 2D
- Projectile Motion
- Motion in an inclined plane
- Relative Motion

# Projectile Motion

- Projectile motion is a form of motion experienced by a launched object.
  - Affected by gravity only

# Horizontal and Vertical Velocity

A body is launched with a speed of  $18.0 \text{ m s}^{-1}$  at the following angles:

**a**  $30^\circ$  to the horizontal

**b**  $0^\circ$  to the horizontal

**c**  $90^\circ$  to the horizontal.

Find the  $x$ - and  $y$ -components of the initial velocity in each case.

# Motion Diagram

# Vertical and Horizontal Displacement

An object is launched horizontally from a height of 20 m above the ground with speed  $15 \text{ m s}^{-1}$ . Determine:

- a** the time at which it will hit the ground
- b** the horizontal distance travelled
- c** the speed with which it hits the ground.

(Take  $g = 10 \text{ m s}^{-2}$ .)

More Formulas, Maximum Height, etc

A projectile is launched at  $32.0^\circ$  to the horizontal with initial speed  $25.0 \text{ m s}^{-1}$ . Determine the maximum height reached. (Take  $g = 9.81 \text{ m s}^{-2}$ .)

Jason Kendall throws a baseball with a horizontal component of velocity of 25 m/s. It takes 3.00s to come back to its original height. Calculate its horizontal range, its initial vertical component of velocity and its initial angle of projection.

Fit Name: Parabola

Fit Builder

Fit Equation:  $y = A*t^2 + B*t + C$

Autofit rms dev: 2.454E-1

Parameter	Value
A	-2.416E2
B	2.042E3
C	-4.280E3

# Questions To Think About

- Why is the trajectory of vertical component vs time is a parabolic function?
- Why is vertical velocity vs time a linear function?

Hint: Kinematics Equations
